## Fresh Thinking and Fresh Innovation create a Fresh Perspective

### How does the TimeWick work?

Oil releases into the TimeWick reservoir at a steady rate. As the reservoir fills, the state of the art sintered polymer wick quickly absorbs the oil, releasing the fragrance into the air. The oil will continue to evaporate off of the wick, distributing the fragrance evenly. As the wick dries out, capillary action drives oil to any porous spots, refilling the wick with fresh oil. The process will repeat for 60 days until the oil has evaporated. The system is completed by the attractive dispenser housing designed to protect the refill cartridge while maintaining maximum air flow characteristics.
